

ABSTRACT. In this paper, we discovered a new sequence of prime numbers, every term of this sequence is either a prime number or equal to 1.

Keywords. Prime numbers, sequence.

INTRODUCTION

A number is said to be a prime number if the number is divisible only by 1 and itself; otherwise it's composite. In this paper, we present two new sequences related with the continued fraction.

THE SEQUENCE $b(n)$

The sequence $b(n)$ satisfy the following recursive formula

$$b(n) = (n - 1)b(n - 1) - nb(n - 2)$$

With the starting conditions $b(3) = 1$, and $b(4) = 7$

Table 1. The first few values of $b(n)$

n	3	4	5	6	7	8	9	10	11
$b(n)$	1	7	23	73	277	1355	8347	61573	523913

Theorem 2.1 For $n \geq 3$.

$$i) \quad \frac{b(n)}{n^2 - n - 1} = \cfrac{1}{2 - \cfrac{3}{3 - \cfrac{4}{4 - \cfrac{5}{\ddots \cfrac{n}{(n-1) - \cfrac{n}{n-(n+1)}}}}}}$$

For $n \geq 5$.

$$ii) \quad b(n) = (2n^2 - 6n + 3).A051403(n - 5) - (2n^2 - 5n + 2).A051403(n - 6)$$

Proof. By using some simplification of the denominator of the continued fraction.

THE SEQUENCE $a(n)$

In this section, we present our sequence of prime numbers defined in the conjecture as follows

Conjecture 3.1. The sequence $a(n)$ of the prime numbers satisfy the following formula

$$a(n) = \frac{n^2 - n - 1}{\gcd(b(n), n^2 - n - 1)}$$

Table 2. The first few values of $a(n)$

n	3	4	5	6	7	8	9	10	11
$a(n)$	5	11	19	29	41	11	71	89	109

Also we have

$$a(37) = a(43) = a(48) = a(53) = 1$$

Conjecture 3.2. every term of this sequence is either a prime number or equal to 1.
